Hands-On Activity: Introduction to BigQuery

Total points 2

1.   1 / 1 point

Activity overview

By now, you have been introduced to BigQuery, a data warehouse on Google Cloud that data analysts can use to query, filter large datasets, aggregate results, and perform complex operations. In this activity, you will explore the BigQuery interface; upload public data to your console; and write some simple SQL queries using SELECT, FROM, and WHERE.

By the time you complete this activity, you will be more familiar with writing queries in the BigQuery interface. This will enable you to practice SQL, which is important for working with databases in your career as a data analyst.

Explore BigQuery

For this activity, you will need a BigQuery account. If you haven't made one already, you can follow the instructions from the Using BigQuery reading, Once you have your account, you can start exploring!

Open your console

1. Log in to BigQuery.

2. Then, click the **Go to console** button on the BigQuery homepage. This will open a new tab with your console.

BigQuery

Migrating data warehouses to BigQuery

Predictive analytics

Bring any data into BigQuery

All features

BigQuery

Serverless, highly scalable, and cost-effective multicloud data warehouse designed for business agility.

New customers get $300 in free credits to spend on Google Cloud during the first 90 days. All customers get 10 GB storage and up to 1 TB queries/month, completely free of charge.

Go to console   **Contact sales**

✓ Democratize insights with a secure and scalable platform with built-in machine learning

✓ Power business decisions from data across clouds with a flexible, multicloud analytics solution

✓ Run analytics at scale with 26%–34% lower three-year TCO than cloud

3. Take a moment to explore your console. On the left side, you will find the **Explorer** menu; this includes a search bar you can use to find resources, pinned projects, and the **+ ADD DATA** button. On the right side, you will find the **Query Editor**. This is where you will input queries and view datasets. You can also find your Job History, Query History, and Saved Queries here.
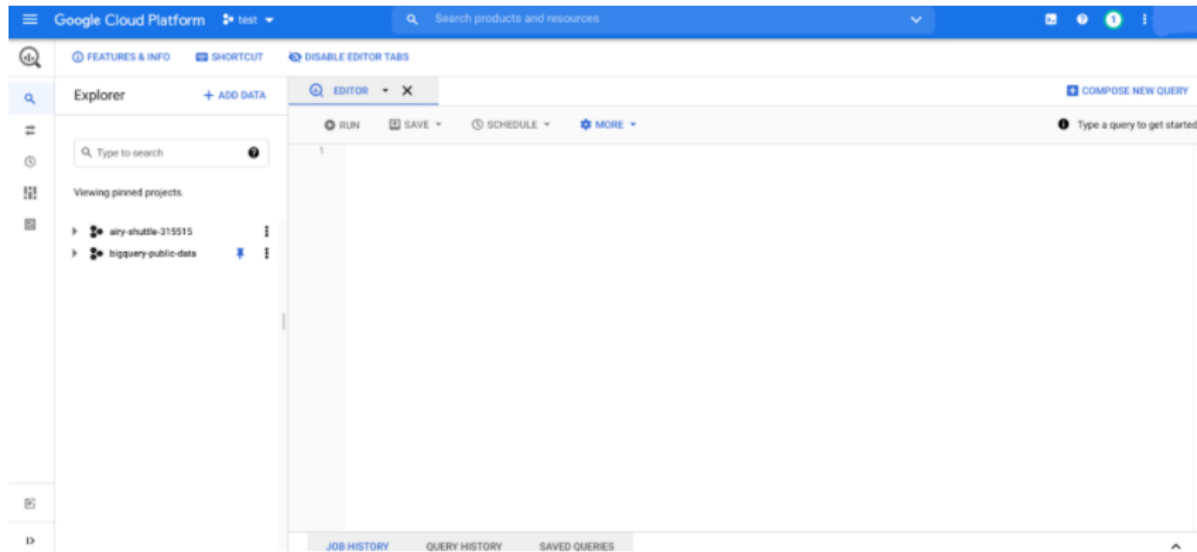

Access public data in BigQuery

In order to actually start writing queries, you will need some data to work with. Once you're familiar with the BigQuery interface, you can access a public dataset directly from your console.

1. Click on the **+ ADD DATA** button in the **Explorer menu pane** and select **Explore public datasets.** This will open a new menu where you can search public datasets that are already available through Google Cloud.
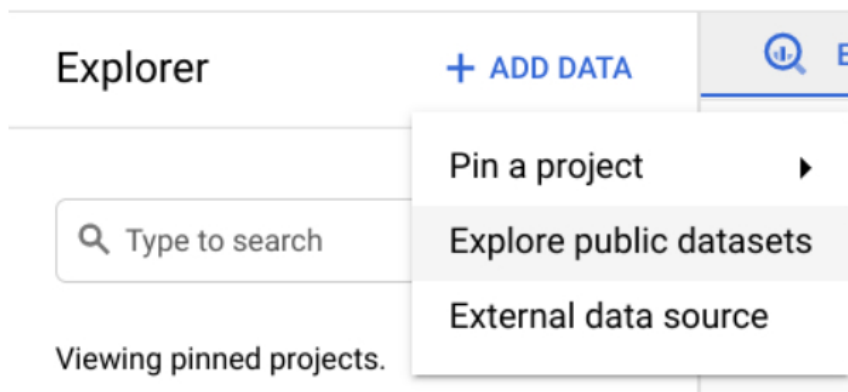

2. In the dataset menu you just opened, **type *london bicycle*** in the search box at the top; this will return the London Bicycle Hires dataset from the Greater London Authority. **Click the dataset** for more details.

London Bicycle Hires

GREATER LONDON AUTHORITY

Greater London Authority

Number of hires of the Santander Cycle Hire Scheme

3. From the dataset information page, **click the blue VIEW DATASET** button. This will open your console in a new tab with this dataset loaded.
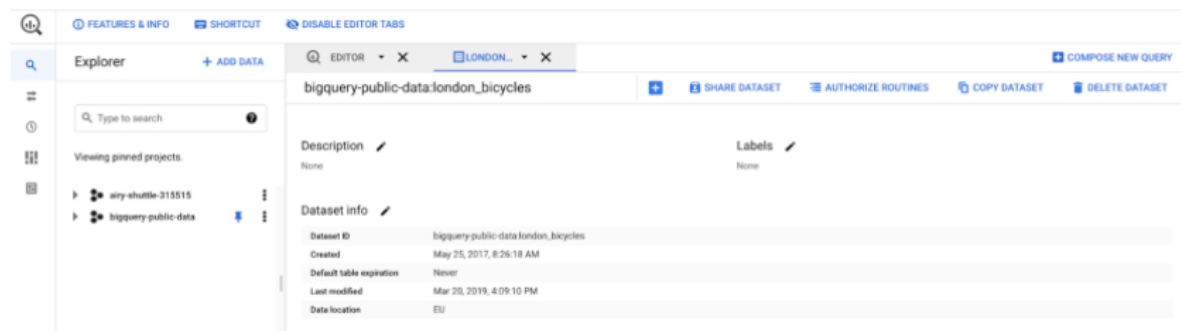

You'll notice that **bigquery-public-data** is now pinned in your Explorer pane. You can now explore and query these public datasets.

4. Click on **the arrow** next to **bigquery-public-data** and scroll down the list of public datasets until you find the **london_bicycles** data. When you click on the dataset, it will list two tables. Click on **cycle_hire**.
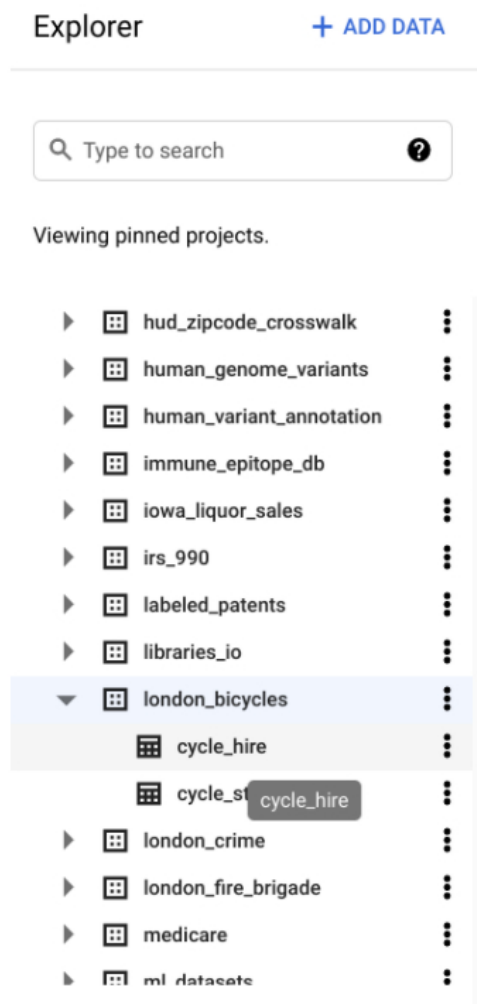

This will pull up a new tab in your Query Editor with information about the table schema.

5. After checking out the table schema, you can take a peek into what data the cycle_hire table contains by clicking on the **Preview** tab. This will give you a better idea of what kind of data you'll be working with.

Once you have finished previewing the data, you can write a query!

Query your data

So far, you've learned three basic parts of a query: SELECT, FROM, and WHERE. As a refresher, here are what those basic parts represent in the query:

- **SELECT** is the section of a query that indicates what data you want SQL to return to you
- **FROM** is the section of a query that indicates which table the desired data comes from.
- **WHERE** is the section of a query that indicates any filters you'd like to apply to your dataset

Write a basic query

Now, construct a simple command using the basic parts of a query you have already learned! For example, you can select a specific column from the cycle_hire table, such as the **end_station_name** column.

1. Start your query with a **SELECT clause** and indicate which column you want to select from the table; in this case, you'll input **end_station_name**.

2. After you have indicated which column you are selecting, write your **FROM clause**. You will need to specify the table you are querying from by inputting the following location: `bigquery-public-data.london_bicycles.cycle_hire`;

The completed query should appear like this:

```
SELECT

    end_station_name

FROM

    `bigquery-public-data.london_bicycles.cycle_hire`;
```

3. Run your completed query by clicking on the blue **RUN** button.

This query may take a few seconds to execute. Once it has finished, you will find the list of station names you requested under the **Query Results** console pane.

Write a query to answer a question

After running the first basic query, try answering a specific question about the data. For example, how many bike trips lasted for 20 minutes or longer?

1. Click **COMPOSE NEW QUERY** to start a new query. Start with your **SELECT statement** again. This time, you will want to include all of the columns in the table for this query. You can use an asterisk to indicate that you are selecting all of the data like this: SELECT COUNT(*) AS num_of_trips

2. Then you will add your **FROM statement**. You will be using the same dataset as the previous query: FROM `bigquery-public-data.london_bicycles.cycle_hire`.

3. Finally, you'll add a **WHERE** statement to specify that you want to filter for only bike rides 20 minutes or longer. If you check the preview of this data, you might notice that the duration is recorded in seconds, so you'll specify 1200 seconds in your query. You can write that as WHERE duration>=1200;

Your completed query should be written like this:

```
SELECT

    COUNT(*) AS num_of_trips

FROM

    `bigquery-public-data.london_bicycles.cycle_hire`

WHERE

    duration >= 1200;
```
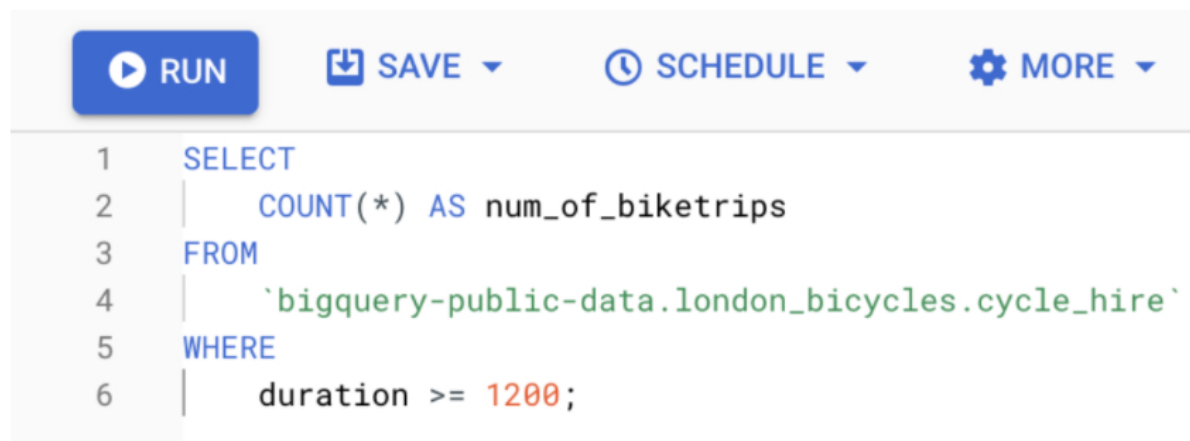

4. Run your completed query by clicking on the blue **RUN** button.

```
   ▶ RUN        ⬇ SAVE ▾        🕐 SCHEDULE ▾        ⚙ MORE ▾

1   SELECT
2   │    COUNT(*) AS num_of_biketrips
3   FROM
4   │    `bigquery-public-data.london_bicycles.cycle_hire`
5   WHERE
6   │    duration >= 1200;
```

This query may take a few seconds to execute. Once it has finished, you will find a list of rides from this table that fit your criteria. There are more than 7 million rows with bike trips that are 20 minutes or longer!

Up for a challenge?

If you're comfortable using queries to answer questions, try creating and running queries to answer any of the questions below:

- What are the names of the stations that bike_id 1710 started from?

- How many bike_ids have ended at "Moor Street, Soho"?

- What is the station_id for "Canton Street, Poplar"?

- What is the name of the station whose ID is 111?

- What is the name of the station whose ID is 111?
- How many distinct bike_ids had trip durations greater than 2400 seconds (or 40 minutes)?

Confirmation and reflection

Run another query on your table:

```
SELECT
    end_station_name
FROM
    `bigquery-public-data.london_bicycles.cycle_hire`
WHERE
    rental_id = 57635395;
```

At what station did the bike trip with rental_id 57635395 end?

- ● East Village, Queen Elizabeth Olympic Park

- ○ Notting Hill Gate Station, Notting Hill

- ○ Southwark Street, Bankside

- ○ Tower Gardens, Tower

> ✓ **Correct**
> The address listed under the end_station_name column for Row 1 of your results table was East Village, Queen Elizabeth Olympic Park. To find this, you successfully ran a query. Going forward, you will continue using SELECT, FROM, and WHERE statements in your queries to interact with databases using SQL. This will help you build more complicated SQL queries when you are analyzing data in the future.

2. In this activity, you had an opportunity to get more familiar with BigQuery and writing SQL queries. In the text box below, write 2-3 sentences (40-60 words) in response to each of the following questions: 1 / 1 point

- How do you think you can use public datasets on BigQuery to help develop your data analysis skills?
- How do you think understanding basic query syntax will help you write more complicated queries in the future?

> How do you think you can use public datasets on BigQuery to help develop your data analysis skills?
> I can use public datasets on BigQuery to help develop my analysis skills by practicing with its databases.
> How do you think understanding basic query syntax will help you write more complicated queries in the future?
> Everything is a journey.

> ✓ **Correct**
> Congratulations on completing this hands-on activity! You explored BigQuery, uploaded public data to your console, and constructed some queries. A good response would include that BigQuery public datasets can help you practice writing SQL.

Being able to construct SQL queries is an important skill for data analysts, because they frequently need to work with databases. In upcoming activities, you will continue working with databases and writing queries with SQL-- an essential tool in every data analyst's toolkit.
